## Accurate Information About Deming And the Mimbres Valley Country

Mayor of Deming Has an Article Prepared by Engineer covering the Salient

ceived a request from L. M. Allen, passenger traffic manager of the Rock Island lines, for accurate information regarding irrigation possibilities in the Mimbres valley, as Ford, Bacon & Davia a prominent firm of engineers in New York city, were desirous of obtaining such information,

Reing desirous of giving reliable and accurate information, mayor Curbet, arranged with R. H. Case, a civil engineer whose ability and judgment would be taken at par or above by any person wanting ground floor facts.

After speaking of the superior rall-road advantages of Deming, the letter says.

The Mimbres valley is a boison plain, or pocket plain, a geologic type which is found frequently in the southwest. It has no drainage outlet. All the water that falls upon its water shed is retained in the subterranean strata of the valley. The Mimbres river proper has a watershed of about 1,500 square miles. It is a percunial atream to where it leaves its narrow mountain valley, and enters the open level siretch of country known as the Lower Mimbres valley, the area of which is some 150,000 acres.

On leaving its mountain valley some 25 miles northwest of Deming, the water sinks, finding its way into the underground water system of the alluvisi and colluvial deposit which fills the valley proper.

derground water system of the alluvial and colluvial deposit which fills the valley proper.

The Underground Lake.

During the rainy season, from June to August the dry channel carries the flood waters excaping the "sink," and also the flood waters draining late it helow the sink, a distance of about 35 miles southeast from its point of exit, distributing these flood waters also into the underground strats.

No lake exists at the "end" of this dry waterbed and what water is not lost by evaporation and absorption along its banks finds its way also into the underground system.

The river as its sink has been gaged through a period of years and some 150,000 acre feet of water pour into the 'aink' at this point annually. In addition to this it is estimated that 250,000 acre feet are added from that part of the catonuses watershed.

The water plane or depth from the depth:

The water plane, or depth from the

2 to 10 strates occurring within that depth.

The water plane, or depth from the surface, varies from 10 to 150 feet, there being an area of probably 125, 1000 acres on which the pumping lift for wells of from 500 to 1,560 gallons capacity per minute will range from 20 to 25 feet.

Big Area Still Open.

Of this 135,000 acres, probably not more than 6,000 acres are under cultivation now. That area will probably be doubled next year, and it is not unlikely that 15,000 acres will have been reclaimed by the close of 1912.

The agricultural history of this valley began in 1003 when the first irrigating well and pumping plant were installed. Prior to that year it was atrictly a cattle country, and its thousands of acres of grass and mesquitaliand afforded range for numerous cattle, Deming at one time being one of the principal shipping points for cattle in the southwest.

The advent of the farmer was hard-

—well improved.

A short time ago mayor Corbett received a request from L. M. Allen, passenger traffic manager of the Rock
laiand lines, for accurate information
regarding irrigation possibilities in the
will be a for a preminent firm of engineers in
New York city, were desirous of obtaining such information.

Feing desirous of giving reliable and
accurate information, mayor Curbett
arranged with R. H. Case, a civil ensuppers whose ability and judgment.

of land are watered entirely with pumps.

Not more than 10 percent of the available 125,000 acres of irrigable land is patented, the balance being held under the homestead or the desert claim act. This land has been located within the last three years, and homestead and desert proofs are being made by actual settlers; but thousands of acres are on the market at the prices above stated, many people being willing to part with their right for a consideration of \$7 to \$15 per acre. The 125,000 acres of available agricultural land has been pretty well determined from wells that have been drilled within this territory. It is not unlikely that future developments will add 50,000 or perhaps more to the commercial area, or what we assume now to be not over an \$5-foot lift.

The Pamping Lift.

Three Bailroads.

Three railroads afford transportation facilities, insuring a market for everything raised. Some of the largest copper mines in the United States are within 50 miles of Deming, this being their natural supply point.

There is a general uniformity, in the brigation pumping plants, the type having been taken from the California field. Wells are dirilled with a boring machine from 150 to 200 feet deep, casing installed in these holes having a perforated area matching the gravel strains which furnish the water. Pits are dug large enough to instal pumps of the vertical centrifugal type, and gasoline engines furnish the required power.

power.

Deming has an electric power plant, sinds of acres of grass and mesquite land afforded range for numerous cattle. Deming at one time being one of the principal shipping points for cattle principal shipping points for cattle in the southwest.

The advent of the farmer was hard. The southwest in the state of the pumping shaft, are used to raise the water. Some 10 plants have been installed close to Deming, and vertical motors, directly connected to the pumping shaft, are used to raise the water. Electric power sells for three cents per K. W. bour. Power developed by gasoline said the valley, saw the one pumping plant this and it appears of far that gasoline engines costs considerably less than the pumping bas an electric power plant, and several miles of transmission line have been constructed with the intentation of determining the commercial possibility of electric power in pumping water. Some 10 plants have been installed close to Deming, and vertical motors, directly connected to the pumping shaft, are used to raise the water. Electric power sells for three cents per K. W. bour. Power developed by gasoline engines costs considerably less than the possibilities and it appears so far that gasoline engines give more satisfactory results.

Cost of Pumps.

This gentleman, who had had some 12 years' experience in pumping water for irrigation in California, installed a plant of 1210 gallons and the commercial possibility of agricultura was definitely determined.

Following his example, others tried the socalled experiment and made good, the result being that today probably 250,000 acres of the available land here has been filed on, and there are in operation some 150 pumping plants irrigating approximately 4600 acres of what was consinered three years ago land fit for graving only.

The agricultural value of this valley land baving: been determined, land values have risen rapidly in the past three years. In the Rio Grande valley, 50 miles west of us, land values, without water rights under these projects will cost approximately 370 and investor First, the character and the miles west of us, land values, without water rights under these projects will cost approximately 370 and investor First, the character and the miles are not approximately 370 and investor First, the character and the miles are several questions which and investor First, the character and the miles are not investor. First, the character and the miles are several questions which and investor First, the character and the miles are several questions.

supply of water. Analysis of the water here shows from 30 to 35 parts of total solids in 100,000 parts of water. It is free from sikall gypsum or lime saits. Its temporary hardness is about 12; its permanent hardness is about 9. It is the purest water in the southwest. That it exists in an inexhaustible quantity is demonstrated.

That it exists in an inexhaustible quantify is demonstrated.

Where the Water Goes.

It is safe to say that 400,000 acrefect of water slak into the underground system annually. This would allow at least three acre feet per acre for 125,000 acres, granting that all of this amount of land were under actual cultivation. Other questions that arise are: Will the soil produce? That has been demonstrated beyond question Next, is there a market for the products raised? Alfairs, Mexican beans, forage crops, potatoes, onlone and fruits are "legal tender." Again, is there sufficient margin of profit left to the farmer after the expense of watering his land is paid?

paid?
Alfaifa yields five cuttings per sea-sen, a ton and a half per cutting. The price ranges from \$12 to \$17 per ton, giving an average gross yield of \$35 per acre. The watering cost for this erop ranges from \$12 to \$15 per acre per year.

per year,
Mexican beans yield from 1200 to
1500 pounds per acre. The price varies
from 4½ to 6½ cents per pound—a fair
average gross yield being \$70 per acre.
The watering cost of this crop varies
from \$3.76 to \$5.50 per acre.
Onions yield as high as \$0,000 pounds
per acre. The price varies from 1½ to
1 cents per pound. The watering cost of
this crop varies from \$7 to \$10 per
acre.

conta per pound. The watering cost of available agricultural land has been pretty well determined from wells that have been drilled within this territor; it is not unlikely that future developments will add 50,000 or perhaps more to the commercial area, or what we assume now to be not over an 55-root Hft.

While there are many districts in California in which water is pumped at a depth of 125 feet for ordinary farm crops the generally accepted belief here is that 55 feet is the limit of commercial pumping. It will probably be demonstrated in the future that this lift can be increased to 100 feet, for the general conditions in this valleys in the southwest.

The bulls of the Mimbres valley are of the typical desert type, producing, when water is available for irrigation, affelf, Mexican beans, forage crops of all kinds, melons, onlons, tomatees, all garden vegetables, and small fruits, together with ordard frolts, including pears, apples, peaches, plums, in fact everything except citrus varieties.

The collinate is semi-arid, the rainfall in the valley proper averaging about eight inches per year. The temperature reaches zero and then for a day only. The ground freezes occasionally to a depth of two or three in these, which leasts but a few days. The maximum summer temperature is about 100. The first frost occurs about the 10th of Cotober. The growing senson is long and vegetable growth, is rapid. The nights are cool and, with all the climate is as nearly deal as can be found.

Three railroads afford transportation, affellities, insuring a market for every-visiting a market for every-visiting and senson is long and the commercial enterprises.

valley. I have been interested in mining, and cattle, and the commercial enterprises in this country for the past 30 years. The real prosperity of the valley is but just commenced, and I unhesitatingly recommend it to your firm for your personal investigation.

I trust you will feel free to call upon me for any specific information you may desire, and it will nlease me greatly to be able to comply with any request you may desire to make. Very respectfully yours,

respectfully yours, & John Corbett, Mayor. R. H. Case, Civil Engineer.

### CHILDREN FLOCK TO STORY TELLER

(Continued from page 1, Section 2)

library is in the basement. It is open every day from hine oclock is the movining until 10 at night. There are over 50,000 books in the circulating department of the main library hesides the branches connected with it. Near this is a newspaper room with papers printed in several languages. A special income of \$1000 annually it provided for the subscriptions of the papers in this room.

The children's library also adjoins the circulating room. It is furnished it old Flemish oak with low, bread window seats, inviting the little folks to cuddle down for a quiet hour. Over 200 children can be comfertably gathered in this room at one time, and each week sees eager crowds of little folks listening to the story teller who is employed by the library to familiarize them with the best literature.

The Electric Book Lift.

On the second floor is a wonderful electric book lift which is the admitization of all who see it. This is in the center of the building. Around it are special studios on different subjects, the privileges of which are open to students in specific lines of learning. There is an oriental department containing rooms devoted to Egyptian, Asiatic and Hebrew lore. This library includes one of the best collections of Semitic literature in the world.

On the second floor also is the

ry includes one of the best collections of Semitic literature in the world.

On the second floor also is the public document department. This has bronze steel fireproof stacks and contains many historic documents, pertaining to the early history of the state. Near it is the music room, which includes a raimable collection from the Lenox library and the Drexel collection. Some priceless manuscripts are numbered in these collections.

Stawart ball, on the third hall, facing Fifth avenue, contains over 3000 vocumes of Shaksperians, including four copies of the first follo. It contains a book appraised as the most costly in the world, the manuscript gospel lectionary by Julio Claudio of the 18th century. This cost \$11,000. In Stewart hall also is a draft of Washington's farewell address, a letter from Columbus, and many other rare historic relice. Stewart hall is one of the most magnificent library rooms in the world. It is supported by the rounds vault of the library. Its doorways are of jasper, its floors are of oak and its cellings are of lustrous bronze. Gallories extend around this room to which access is gained by stairways of wrought bronze. Adjoining it is a portrait room devoted to American subjects only.

This library has been years in the huilding. In 1896 the trustees of the New York public library prought its final cost up to \$11,000,000 was secured by special appropriation. Other sums received for this library brought its final cost up to \$13,000,000 was secured by special appropriation. Other sums received for this library brought its final cost up to \$13,000,000 was secured by special appropriation is due to the care which was taken. In each department the maximum results seem to be reached. The amount of time consumed in its construction is due to the care which was taken. In each department the maximum results seem to be reached. The vantiflation is after an approved system, all the air being fanned through cheese cloth sifters, after which it is comfortable to the body—it is a library built for t

# The One Best Buy

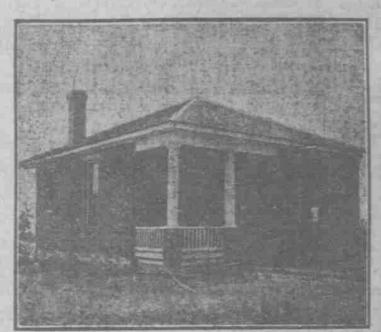

On Account of LOCATION, ACCESSIBILITY, IMPROVEMENTS,

desirability of surroundings; on account of the price, and a certainty of values increasing.

# There Are Other Reasons

The advantages of owning a ranch home within easy reach of the fastest growing town in New Mexico must be apparent to even the casual observer. Our home plots of three acres each adjoin the townsite of Deming, and command a superb view of the magnificent Florida Mountains. We build you a home, we develop the water with which to irrigate the tract, put in an individual pumping plant for you, fence in, in short, make it ready to move into. One-third down, the balance in monthly instalments just like rent. You own a beautiful home before you know it. It's easy money, it's good money—it makes life worth living to own a three acre home in the suburbs of Deming.

These three acres properly handled will make you independent. They will make you your own boss. They will furnish you light, pleasant, out-of-door work. With one of our home plots, you will live longer and be happier. You will be close to market, close to the conveniences of town, close to the best schools in New Mexico, free, independent and un-bossed. It's worth investigating. See us or write us-the proposition is easier and better than you think.

DEMING, NEW MEXICO.
